Green Valley Medical Center - Insight Report

Executive Summary

The analysis covers 400 patient records from Green Valley Medical Center. Average recovery score is 75.34/100, average treatment cost is £5,052, and average hospital stay is 5.35 days. The dashboard uses calculated fields for age group, cost category, stay category and recovery status.

Patient Recovery

Dermatology (76.61) and General Medicine (76.57) have the highest average recovery scores. Cardiology has the lowest average recovery score at 72.92, despite having one of the higher average treatment costs (£5,255). This indicates an opportunity to review patient pathways, case complexity, and post-treatment follow-up in Cardiology.

Treatment Effectiveness and Cost

Surgery records the highest average recovery score (76.84), but it is also the highest-cost and longest-stay treatment type, with an average cost of £12,619 and average stay of 10.07 days. Observation has the lowest cost (£1,080) and shortest stay (2.09 days), but the lowest recovery score (72.86).

Demographic Patterns

Young Adults (20-35) show the highest average recovery score (76.20), while Teen patients (13-19) show the lowest average recovery score (73.93). Gender differences are small between Male and Female patients, while the 'Other' category has only 5 records, so it should not be over-interpreted.

Doctor Performance

Dr. Johnson has the highest average recovery score (78.51) and the strongest excellent recovery rate among doctors. Dr. Smith has the lowest average recovery score (69.78), so the hospital should investigate whether this is caused by case mix, treatment allocation, documentation quality, or follow-up processes.

Recommendations

1. Prioritize a Cardiology improvement review focused on diagnosis-to-treatment workflow, treatment mix, and discharge follow-up.
2. Compare Surgery outcomes against costs to identify where high recovery justifies high resource use and where cost savings are possible.
3. Review Observation protocols because this treatment type is cost-effective but has weaker recovery results.
4. Share best practices from Dermatology, General Medicine, and high-performing doctors across departments.
